From Egg to Apex

6 steps to vibe code a classroom web app with Claude, Gemini or ChatGPT.
Sample expedition: a sleep review app for AP Psychology.

EGG

PART 1 · PLAN THE EXPEDITION

1

STEP 1 · DECIDE WHAT TO BUILD

Choose your dig site

One problem, one small app. Start with something you already teach: a worksheet students rush through, a review activity that falls flat, or a concept students always mix up.

EXAMPLE
My AP Psych students mix up the sleep stages and what happens in each one.

2

STEP 2 · WRITE YOUR PROMPT

Pack your field kit

Give the AI everything it needs: your **topic, standard and what students should be able to do**; your **vocab and questions** (or paste in the handout itself); and your **grade, reading level, devices and accessibility needs**.

EXAMPLE PROMPT
"I'm a teacher. Build me an interactive review app for my AP Psychology students on Unit 1, sleep. Start with a graph of one night of sleep; students tap a stage to see what the brain and body are doing. Add scenario questions: if they pick wrong, explain why but don't give the answer. Build it as one self-contained HTML file with no logins."

PART 2 · HATCH IT

4

STEP 4 · TEST AND REVISE

Evolve it

Play it like a student: try wrong answers and check every fact. Then ask for one change at a time. If something breaks, describe what you see.

EXAMPLE PROMPTS
"Add flashcards with a read-aloud button."
"Give it a night-sky theme."

Expect a few rounds: test, ask for a change, and test again until it's right.

3

STEP 3 · GENERATE THE APP

Hatch it

Type your prompt and let the AI build a first draft. Don't expect perfect: a first draft is a starting point.

EXAMPLE
Start from the starter prompt in **Hatch your first app**. Paste it into **Claude**, **Gemini** or **ChatGPT** and hit go. In about a minute, a playable app appears.

PART 3 · RELEASE IT

5

STEP 5 · SHARE IT WITH STUDENTS

Release it into the wild

Give students a plain web link, no AI account needed. We use **Google Apps Script** (step-by-step guide on our website). You can also use **Netlify**, your **LMS** or a **Google Site**.

EXAMPLE PROMPT
"Convert this into a Google Apps Script web app I can embed in Canvas, and tell me exactly where to paste each file and how to deploy it."

APPS SCRIPT TIPS
Set **Who has access** to **Anyone**. After changes, deploy a **New version**. Test your link in a **private window**.

6

STEP 6 · REUSE YOUR PROMPT

Leave your tracks

Save the recipe so the next app takes minutes: a prompt template, a Claude Project, or a Claude skill. Using Gemini or ChatGPT? Save it as a Gem or a custom GPT.

EXAMPLE PROMPT
"I want to create a skill for building review games for my class." (Attach your best prompt and an app you liked.)

APEX
Now go build!
